

COMO GOLD BARRING FURNACES

Como Engineers have been busy completing our latest order of diesel fired Gold Barring Furnaces.

Designed to be easy on maintenance, the furnace is driven by a high-low packaged diesel burner (or optionally an AFR type burner) and can also be supplied in either Natural Gas or LPG.

Three of these (A1000's) are destined for the Philippines, while the smaller ones (A300's) will be delivered to mines in Mali and Argentina.

All our furnaces are fully pre commissioned in our North Fremantle workshop prior to packing for shipment to ensure quick and reliable commissioning onsite.

In addition to our process engineering design and execution capabilities, Como Engineers have a complete range of elution and gold room equipment and spares as part of our service offer.

Como Engineers – proudly exporting our technology and know-how globally.

That's the Como Difference.
